

# NanoOxygen

## SYSTEMS

OXYGEN DELIVERED

# 3 NanoOxygen Systems Options!!!

**01**  
OPTION

## Portable Trailer System

Have the flexibility to move our portable trailer system from pond to pond, improving water quality on all golf course ponds and reducing Cyanobacteria. Available for purchase or lease.

## Irrigation pond treatment and wet well irrigation water enhancement

Our most popular system - treat the irrigation pond during non-irrigation periods to build a concentration of nanobubbles and improve pond water quality that can be used across the entire golf course (ie: lake fills). Eliminate algae and bottom muck in the irrigation pond. Then when irrigating, pull in the high dissolved oxygen water directly to the wet well and out to the golf course to reduce pesticides and fertilizers. Greatly improve soil health with elevated DO approaching 2-3X rainwater levels. ORP monitoring controls ozone to manage pathogen and cyanobacteria in the pond.

## Well pump and irrigation pump station water quality improvement

Single pass oxygen and zone injection into high pressure irrigation streams (well pump and pump stations) raises dissolved oxygen in the soil root zone and directly impacts soil health and turf quality. Commercial systems are now operating in golf courses, greenhouses, and other applications to improve water quality. This option is very effective for situations where no irrigation pond or well is available.
